DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 10, 11, and 14-18 are rejected under 35 U.S.C. 103(a) as being anticipated by Dustan et al., USPN 5,88,312 in view of See et al., USPN 6,070,243.

With regard to claim 10, Dustan discloses a base station (database server) including a computer (fig 1) that transmits a prompt within the framework of an initial successful prompt/reply cycle (SSL, column 11 lines 49-60) where the prompt is stored in the base station (session key of SSL), and a remote control device (client) which stores the prompt (session key of SSL), wherein, in an access authorization process during system operation, subsequent to the initial prompt/reply cycle, the remote control device (client) transmits a reply (column 8 lines 63-66) to the base device (database server) partially a function of the initial prompt (SSL session key, column 9 lines 3-8), the base station receives the reply and compares it with the required reply (column 9 lines 1-3), and grants access accordingly (column 9 lines 8-16). Dustan does not disclose erasing the SSL session key after a number of failed attempts. See discloses terminating a session with a user after a predetermined number of failed login attempts

(column 11 lines 15-38). It would have been obvious for one of ordinary skill in the art to use the method of See to delete the SSL session key of Dustan after a number of failed attempts as to not allow a hacker unlimited attempts to break into the system.

With regard to claim 11, an SSL session key is formed using the remote control's unique public key.

With regard to claims 14-17, Dustan does not disclose including a count in accessing the database. The examiner takes official notice that it is well known in the art to limit access to a number of logins. It would have been obvious for one of ordinary skill in the art to include a count in accesses in Dustan in order to prevent unlimited access for the motivation of control and profit (charging for more accesses). Support for this assertion can be seen in art previously presented, Abraham, USPN 5,745,576.

Abraham discloses a reply that includes a transaction count (column 9 lines 24-26), which is tracked (column 10 lines 22-24), changed (column 10 lines 31-35), and encrypted (column 9 lines 24-26).

With regard to claim 18, Dustan discloses the system of claim 10, as outlined above, but does not mention wireless communication or frequencies. The examiner takes official notice that it is well known in the art to have different wireless device working on different frequencies. Since this official notice was previously taken and not traversed, it is taken as admitted prior art. It would have been obvious for one of ordinary skill in the art to us Abraham's system in a wireless environment with different frequencies to avoid interference and allow mobility.

Conclusion
